1. How did analyzing the Figma prototype help you plan your HTML structure?
   Analyzing the Figma prototype helped me plan my HTML structure by guiding me to how many sections there needs to be and the div to put within them. Having the visual example of what we need to create helps the developing process go by not only efficiently but smoothly. Instead of typing everything, you are able to copy and paste it.

2. What was one decision you had to make when translating the design into code?
   The one decision I had to make when translating the design into code is how many rows are there in order to calculate how many sections I would need on my page.

3. Which layout method (float or Flexbox) did you use more, and why?
   I think I ended up using the Flexbox method more because you have high control when it comes to the alignment of the elements you're putting onto your website.

4. How did the box model (margin, padding, border) affect your layout and spacing?
   The box model affected my layout and spacing by basically determining how each element occupied the space and the size itself as it is alongside with neighboring elements. If that element moves, so do the ones around it.

5. What challenges did you face when linking and maintaining consistency across multiple pages?
   I would say the challenges I faced was making sure I stayed consistent with the naming of the css.style when it comes to editing a specific element. Not only do I need to make sure I spelled it correctly but also if I worded it correctly throughout.

6. How did you approach recreating visual elements (such as emojis, buttons, or shapes) using code instead of images?
   I'd say this approach is much easier than uploading images, instead of worrying about if the image folder syncs onto the design code in order for it to show up onto your live page, you just have to put in a specific existing code for a specific visual element.

7. What did you learn about organizing your files and code for a multi-page site?
   I learned that you are able to not only save your progress but you are able to see what you changed specifically whenever you save your file and you are able to look back onto them.

8. What was one challenge you faced when creating or styling the contact form?
   One challenge I faced was where to even start at all, but whenever I followed along with the video I seemed to understand it a lot better- just that I had to double take on the contents of the coding provided.

9. If you had more time, what would you improve about your website?
   If I had more time, I would have changed the colors and played around with the font styling.

10. What is one skill from this project that you feel more confident using moving forward?
    One skill from this project I feel more confident in using moving forward is utilizing the section and the div elements when designing my website.
